

Pneumatic Tool Set 2pcs - 14 Piece Set

Instructions for use

Translation of the original instructions

KEEP THIS MANUAL

This document contains safety and operating instructions and warranty information.

Keep the document together with the proof of purchase in a dry place.

WARNING: Before using the unit, read this manual and follow the instructions for safe operation of the unit.

IMPORTANCE:

After purchasing the appliance, read this manual and follow the instructions for safe operation of the appliance. Keep this document for future reference.

OPERATIONAL AND SAFETY INFORMATION

Pneumatic tools work at different working pressures. The recommended pressure for most equipment is 6 bar.

Higher pressures reduce tool life due to high loads.

Water in the compressed air supply can cause damage to the equipment. Therefore, it is necessary to remove water from the compressor or piping regularly! Clean the air filter at least once a week.

Commissioning and maintenance of pneumatic tools

When manufacturing our pneumatic tools, we have tried to design the tools to consume as little air as possible. Pneumatic tools can be run with a compressor with a suction capacity of up to 230 litres in certain circumstances. Ideal performance is provided by a compressor with a suction capacity of 300 - 400 litres. We therefore recommend using compressors from the 300/11/40, 400/11/50, 400/11/60, 600/11/60, 600/11/90 and larger series.

In particular, we recommend the use of the compressor 631/10/90, 380 V, 10 bar. All pneumatic tools can be operated with this compressor without restriction.

1. Pneumatic piping
2. Pressure regulator
3. Couplings 3/8"
4. 3/8" end cap
5. Tool
6. No quick coupling directly in the machine
7. Front hose 3"
8. Special pneumatic piping. To prevent pressure drop, use the shortest possible line
9. Lubricate daily with oil
10. Pneumatic piping
11. Lubrication equipment
12. Filter
13. Remove water daily

The following information must be observed before using air tools.

1. Pneumatic tools should only be operated with the lubrication device running.
2. A pressure reducing valve must be fitted on the compressor (all compressors are fitted with a pressure reducing valve).
3. A water filter must be fitted before the lubrication device is installed.
4. The maximum operating pressure of the air tool is 6 bar. If you set the pressure reducing valve above 6 bar, the air tool may be overloaded.
5. If you do not use the machine for a long time, it is recommended to clean and oil the air tools thoroughly. When restarting, add a small amount of oil to the air tool connector and then run the machine with the lubrication device switched on. Some units allow infinitely variable speed and power control. This adjustment is made using the screw next to the air source connection.

RICE KEY

Technical data

Power	~0.34 KW
Maximum unscrewing torque	310 Nm
Maximum screwdriving torque	250 Nm
Revolutions	7000 rpm.
Capacity (maximum thread size)	M 16
Maximum permissible operating pressure	6 Bar
Noise level	89 db (A)
Vibration level	<2,5 m/s ²
Square buckle	1/2
Air consumption	Approximately. 6 l/s
Recommended inner part of the hose	9 mm
Weight	2,3 kg
Air consumption at maximum torque	Approximately. 350 l/min

Air quality:

The air supplied to the unit must be clean.

Adjustment:

The operating pressure set at the pressure reducing valve is 6 bar.

Description

No.	Description
A	Screw locking component
B	Directional switch
C	Release lever
D	Air or torque regulator
E	Pneumatic connector

Purpose of the device

These pneumatic tools are designed for tightening and loosening bolts on cars (e.g. for mounting tyres, loosening chassis bolts) and for various assembly and disassembly work in agriculture.

The air is discharged through an outlet on the side. Installation of the accessories is quick and very easy. The pneumatic connector is equipped with a quick coupler. Care must be taken when tightening the bolts and nuts.

The following instructions should be observed:

Wear suitable protective clothing when working with the equipment. Safety regulations must be observed.

Security

Protect yourself and your surroundings by taking all measures to prevent accidents.

- The equipment must not be used for purposes other than those for which it is intended.
- Pneumatic tools should be kept out of the reach of children.
- The device may only be used when the user is fully focused and relaxed.
- The operating pressure must be adjusted using the control valve.
- Neither oxygen nor gaseous fuel shall be used to power the equipment.
- Disconnect the equipment from the compressed air supply before carrying out repairs.
- Use only original spare parts.
- Do not allow the unit to run at full speed with no load.
- Wear suitable protective clothing when operating the unit.

Start

Screw the pneumatic connector onto the fitting (E) and fix it with Teflon tape. Fit the handle onto the unit (A). Set the correct direction of rotation on the switch lever (B):

Moving backwards = loosening bolts

Moving forwards = tightening bolts

Fit the handle. Pull the trigger (C). The air supply can be regulated using the air regulator (D).

Mark 9 = maximum tightening torque (4)

Mark 0 = minimum tightening torque (1) A flexible air hose with quick coupling is used to connect the compressed air supply.

Maintenance

By following the maintenance instructions, you will ensure a long service life of the appliance as well as product quality and trouble-free operation. Disconnect the air supply before performing any maintenance. To ensure trouble-free operation and performance, the appliance should be cleaned daily and lubricated regularly. For this purpose, use a lubricant designed for pneumatic equipment only.

a) Use of lubrication equipment

Install the lubrication device in the unit's piping system close to the unit (a distance of approximately 50 cm). The lubrication device provides the correct amount of lubricant. If the impact wrench is not used for an extended period of time, apply 5-10 drops of oil to the pneumatic connector.

b) Manual lubrication

If the impact wrench is not equipped with a maintenance or lubrication device, lubricate the pneumatic connector with 3-5 drops of special lubricant before each start-up. Pneumatic equipment should be stored in a dry room.

Screwdriver with ratchet

Technical data

Idling speed	160 rpm
Power	0.272 kw
Maximum unscrewing torque	40 Nm
Capacity (maximum thread size)	M8
Maximum permissible operating pressure	6 bars
Noise emissions according to DIN 45635 part 20/09.90	
Sound power level L _{WA} max.c	103 dB (A)
Noise level at the workplace L _{PA} max.	93 dB (A)
Maximum sound pressure level L _{PA} max. 1m	90 dB (A)
Vibration according to DIN EN 28662 part 1/01.93 or E DIN ISO 8662 part 1/01.93	14.7 m/s ²
Square buckle	1/2
Air consumption	Approximately. 310 l/min
Recommended inner part of the hose	6 mm
Weight	1,24 kg

Air quality:

The air supplied to the unit must be clean.

Compressor capacity: capacity: 180 l/min. 1.5 kW equivalent

Adjustment:

The operating pressure set at the pressure reducing valve is 6 bar.

Construction

No.	Description
040	Release lever
170	Drive
390	Change direction
430	Pneumatic connector

Purpose of the device

This pneumatic tool is designed for tightening and loosening bolts on cars and for various assembly and disassembly work in agriculture.

The air is discharged through the outlet at the front. The device is ideal for working in hard-to-reach places. Installation of accessories is quick and very easy. The pneumatic connector is equipped with a quick coupler. Care must be taken when tightening bolts and nuts.

Security

Protect yourself and your surroundings by taking all measures to prevent accidents.

- The appliance must not be used for purposes other than those for which it is intended.
- It is forbidden to touch moving parts of the equipment.
- Pneumatic tools should be kept out of the reach of children.
- The device should only be used when the user is fully focused and relaxed.
- The operating pressure must be adjusted using the control valve.
- Neither oxygen nor gaseous fuel shall be used to power the equipment.
- Disconnect the equipment from the compressed air supply before carrying out repairs.
- Use only original spare parts.
- Do not allow the unit to run at full speed with no load.
- Wear suitable protective clothing when operating the unit.

Start

The coupling (430) should be screwed onto the reducing fitting. A ring or socket wrench should be used for this purpose. Note: the thread must be fixed with Teflon tape.

Place the handle on the unit (170). Connect the air hose to the fitting using the quick coupler. Fit the handle onto the screw. Set the desired direction of rotation on the control lever (390) and release lever (040).

Maintenance should be carried out by suitably qualified persons.

By following the maintenance instructions, you will ensure a long service life of the appliance as well as product quality and trouble-free operation. Disconnect the air supply before performing any maintenance. To ensure trouble-free operation and performance, the appliance should be cleaned daily and lubricated regularly. For this purpose, use a lubricant designed for pneumatic equipment only.

a) Use of lubrication equipment

Install the lubrication device in the unit's piping system close to the unit (a distance of approximately 50 cm). The lubrication device provides the correct amount of lubricant. If the ratchet screwdriver is not used for a long time, apply 5-10 drops of oil to the pneumatic connector.

b) Manual lubrication

If the ratchet screwdriver is not equipped with a maintenance or lubrication device, lubricate the pneumatic connector with 3-5 drops of special lubricant before each start-up. Pneumatic equipment should be stored in a dry room.

Environmental protection

Electrical products must not be disposed of with household waste. They must be disposed of in designated recycling facilities. For information on how to dispose of electrical appliances, contact your local authority.
